

Astro-Online System Requirements

The installation of Astro-Online requires the following components:

- Servlet container, such as Apache Tomcat or JBoss Application Server with JDK 1.5 or higher
- MySQL database access

Astro-Online was tested with Apache Tomcat, JBoss and OC4J on OS X, Linux and Windows. Other operating systems and/or application servers have not been tested, but should work as well as the application is a pure Java solution.

By default Astro-Online uses MySQL for data storage. Support for other databases should be fairly straight forward though, but require the implementation of other database driver calls.

Good luck and have fun!
